SOLARWIND AI AGENT – TABLE CONFIGURATIONS

For your **SolarWinds AI Agent**, don't just store the 19 columns you're currently fetching. Think about the future use cases:

- AI Reports
- Forecasting
- Trend Analysis
- RCA (Root Cause Analysis)
- Ticket Generation
- Executive Dashboards
- Capacity Planning

I'd separate the data into **Master Data** and **Snapshot Data**.

1. Device Master Table

Store information that rarely changes.

solarwinds_devices

Columns:

NodeID
Caption
IPAddress
Vendor
MachineType
NodeCategory
NodeType
City
ITSM_Location
Contact
NodeDescription

Reason:

Inventory
Grouping
Filtering
Ownership
Ticket Assignment

Example:

NodeID: 123
Server: APP-PROD-01
Vendor: Cisco
Category: Network
Location: Bangalore
Owner: Network Team

2. Daily Snapshot Table (Most Important)

solarwinds_device_snapshots

Store one record per device per collection cycle.

Columns:

SnapshotDate
SnapshotTimestamp
NodeID
Status
StatusDescription
CPULoad
PercentMemoryUsed
ResponseTime
AvgResponseTime
HealthCurrent

Example:

2026-10-26
CPU=45
RAM=71
Health=High
2026-10-27
CPU=82
RAM=84
Health=Medium
2026-10-28
CPU=93
RAM=88
Health=Low

This becomes the foundation for forecasting.

3. Alert History Table

Store generated alerts.

solarwinds_alerts

Columns:

NodeID
AlertType
Severity
Message
GeneratedTime
Status

Examples:

High CPU
High Memory
Device Down
High Latency

4. AI Insights Table

solarwinds_ai_insights

Columns:

NodeID
AnalysisDate
RiskScore
RiskLevel
Trend
Forecast
RootCause
Recommendation
LLMSummary

Example:

Risk: High
Cause:
CPU has increased 35% over 14 days
Recommendation:
Scale resources

5. Forecast Table

solarwinds_forecasts

Columns:

NodeID
ForecastDate
PredictedCPU
PredictedMemory
PredictedHealth
ConfidenceScore
ForecastReason

6. Ticket Mapping Table

solarwinds_tickets

Columns:

NodeID
TicketNumber
CreatedDate
Reason
Status
ResolvedDate

Most Important Columns for Future AI

If I had to pick only the absolutely critical fields:

NodeID
Caption
NodeCategory
SnapshotDate
Status
StatusDescription
CPULoad
PercentMemoryUsed
ResponseTime
HealthCurrent

Why These Matter

Forecasting

Need:

NodeID
Date
CPU
Memory

Trend:

40
45
50
60
75
85

Prediction:

95 in 4 days

AI Reports

Need:

HealthCurrent
Category
CPU
RAM
Status

AI can say:

Network devices account for
70% of unhealthy assets.

Ticket Generation

Need:

NodeID
HealthCurrent
CPU
Memory
Status

Rule:

Low Health
→ Create Ticket

Root Cause Analysis

Need:

ResponseTime
CPU
RAM
Status
Historical Trend

Example:

Response time increased from
50ms to 400ms.
CPU simultaneously increased
from 35% to 93%.

My Recommended Final Snapshot Schema

Store this every day at 8 AM:

SnapshotDate
SnapshotTimestamp

NodeID
Caption
NodeCategory
NodeType
Status
StatusDescription
CPULoad
PercentMemoryUsed
ResponseTime
AvgResponseTime
Vendor
MachineType
HealthCurrent

This is enough to support:

- ✅ AI Reports
- ✅ Forecasting
- ✅ Trend Analysis
- ✅ Ticket Creation
- ✅ Dashboards
- ✅ Executive Reporting
- ✅ Historical Comparisons
- ✅ Future ML Models

and will likely remain useful even when your SolarWinds Agent grows significantly.
